Experimental eCLIP data from wild-type cells

This document contains the required steps to generate the results for section *3.2.2: Experimental Scenario 2: RBFOX2 eCLIP data on wildtype cells*.

Please follow the instructions in materials and methods within the main manuscript to download and process the experimental data. Pull a Docker image with all the required packages installed (`docker pull ecvpaper2024/ecv_results`).

Data preparation.

        Enhanced Coefficient of Variation and IDR Extensions
                  for Reproducibility Assessment

This package provides extensions and alternative methods to  IDR  to
measure the reproducibility of omic data with an arbitrary number of
replicates. It introduces an enhanced Coefficient of Variation (eCV)
metric to assess the likelihood of omic features being reproducible.

  ),
  mIDR = list(
    mu = 2.5,
    sigma = 1,
    rho = 0.8,
    p = 0.5,
    eps = 1e-3,
    max.ite = 100
  )
)
```

Data analysis.

FOX2 motif enrichment.

Create peak IDs.

```
eclip_data <-
  eclip_data %>%
  mutate(ID = paste0(chrom,":",start,"-",end,strand),
         score = 0)
```

Export table as a bed file.

```
eclip_data %>%
  dplyr::select(chrom, start, end, ID, score, strand) %>%
  write_tsv(file = "eclip_data.bed", col_names = FALSE)
```

Detect peaks matching FOX2 binding motif with Homer.

```
bin/findMotifsGenome.pl "eclip_data.bed" \
      GRCh38.p13.genome.fa \
      .aux \
      -find FOX2_all.motif -rna -size 75 \
      > "eclip_data_homer_res.bed"
rm -f -r .aux
```

Load Homer's results.

```
eclip_data <-
  eclip_data %>%
  mutate(motif=eclip_data$ID %in%
           read_delim(file = "eclip_data_homer_res.bed",
                      col_types = cols())$PositionID)
```

Features distribution.

```
gtf <-
  import.gff("gencode.v41.chr_patch_hapl_scaff.annotation.gtf")
```

make TxDb.

```
